

SAGE Scoring Model

Factor Weights & Configuration

Generated May 19, 2026 · Threshold: 65/100 · Weights are DB-driven via `scoring_factors` table

Active Scoring Factors

Factor	Key	Weight	Description
IV Rank	<code>iv_rank</code>	+9	Current IV vs 52-week range — higher = richer premium environment
VIX	<code>vix</code>	+7	Market volatility index — elevated VIX = better STO conditions
IV Percentile	<code>iv_percentile</code>	+6	% of past days where IV was lower than today
RSI (14)	<code>rsi_14</code>	+6	Overbought (>70) favors call selling; oversold (<40) penalizes
Change %	<code>change_pct</code>	+5	Stock up today — rising stocks make OTM calls safer to sell
IV %	<code>iv_pct</code>	+5	Raw ATM implied volatility percentage
Ticker Win Rate	<code>ticker_win_rate</code>	+5	Historical profit rate for STOs on this specific ticker
Fib Near Resistance	<code>fib_near_resistance</code>	+4	Price near a Fibonacci resistance level — natural ceiling
Fib Broke Below	<code>fib_broke_below</code>	+4	Price broke below a Fibonacci level — bearish momentum
S/R Near Resistance	<code>sr_near_resistance</code>	+4	Price near a key resistance level — limits upside
Pullback from High	<code>pullback_from_high</code>	+4	Stock fading from intraday high — momentum decelerating
Deceleration	<code>deceleration</code>	+4	Rate of price increase slowing — safer to sell into
OTM %	<code>otm_pct</code>	+3	How far out of the money the strike is (2-3% is sweet spot)
Bollinger %B	<code>bb_pct_b</code>	+3	Position in Bollinger Bands — lower = more room to run down
Gap Flag	<code>gap_flag</code>	+2	Stock gapped up at open — elevated IV, gap fill potential
Fib Near Support	<code>fib_near_support</code>	-5	Price near Fibonacci support — stock may bounce, increasing risk
S/R Near Support	<code>sr_near_support</code>	-4	Price near key support — reduces covered call safety
	TOTAL	+71 / -9	Max possible raw score before normalization

Disabled / Not Yet Implemented

Factor	Key	Reason
DTE	<code>dte</code>	Circular — expiry is chosen by trader, not a quality signal
Time of Day	<code>time_of_day</code>	Scanner rules already handle timing — redundant
Days Since Last STO	<code>days_since_last_sto</code>	Risk management rule, better as a hard filter than score input
Sector ETF Change	<code>sector_etf_change</code>	Not yet implemented — no data source connected

Factor	Key	Reason
Short Interest	<i>short_interest</i>	Slow-moving data — not reliable for intraday signals
Insider Buying	<i>insider_buying</i>	Too slow-moving and noisy for intraday use
Put/Call Ratio	<i>put_call_ratio</i>	Difficult to source reliably in real-time

- *Scoring: rawScore / maxPossible * 100, clamped to 0-100. Only enabled factors with data contribute to maxPossible.*
- *Gates (hard blocks regardless of score): VIX < 18, stock change < +0.5%, overbought (upper Bollinger Band).*
- *Weights are stored in the scoring_factors table and loaded dynamically at scan time — no code deploy needed to adjust.*
- *ticker_win_rate and deceleration/pullback_from_high are computed but not yet reliably stored — weights are provisional.*
